Problem Statement & Project Goal Statement

EventSafe Custom Checklist Management Tool
CivicaGov Solutions Sdn Bhd

Problem Statement

CivicaGov Solutions Sdn Bhd provides a safety checklist application called **EventSafe**. The application currently faces two layers of problems.

Layer	Problem Description
Layer 1	Due to the obsolete ingestion tooling which causes content specialists to rely on manual database scripts to create or update customized safety checklists, simple checklist updates take over 70% of the content team's operational capacity, and custom content requests end up taking three to four weeks to process.
Layer 2	A breakdown in compliance tracing due to the fact that event organizers and compliance officers resort to paper documents, PDFs, and emails to handle the custom safety requirements, which operate outside the system. This breaks the dual-approval audit trail, which makes it difficult to verify whether both the compliance officers approved the custom content and the event organizer acknowledged the custom risk conditions. It also leaves an incomplete digital history of custom content changes and approval actions, making responsibilities difficult to trace. Thus, these issues create risks that relate to legal liability, insurance validity, and municipal audit standards.

Project Goal Statement

The goal of this project is to design and prototype a web-based custom checklist management tool for EventSafe that aims to address the two layers of problems. The project goals will focus on **reducing the custom content processing time, while making sure both digital sign-offs are recorded, as well as maintaining a complete and temper-evident history of content changes and approvals.**

The project goals are broken down as follows:

1. The prototype will **reduce custom content processing time** from three to four weeks to under 24 hours by the end of **Sprint 2** for the purpose of allowing content specialists to create and update custom safety checklists without manually running database scripts **(Layer 1).**
2. The prototype will **ensure that 0% of custom checklists marked as fully approved are missing either required digital sign-off** by the end of the **Sprint 3**, for the purpose of reducing reliance on the off system workarounds and keeping records of both the compliance officer's digital approval and the event organizer's digital acknowledgement **(Layer 2).**
3. The prototype will **record 100% of custom content changes and approval sign-offs made through the prototype in a temper evident audit trail** by the end of **Sprint 4**, for the purpose of supporting compliance audits by showing who performed each action and when **(Layer 2).**

Project Scope

In Scope

Area	Description
Dynamic content authoring	Allow content specialists to create and update custom safety checklists through an interface that does not require manual database scripting. Support flexible checklist structures without hardcoding databases.
Custom request tracking	Provide a view of pending custom-content requests and their progress to help the content team manage its workload.
Digital dual-approval gateway	Allow compliance officers to review and approve or reject custom content, and event organizers to digitally acknowledge the custom risk conditions. Both required sign-offs would be recorded within the system.
Tamper-evident audit trail	Preserve a history of custom-content revisions and approval actions, including who performed each action and when, with evidence of alterations to the audit records.
Three core user roles	Support event organizers, internal compliance officers, and content specialists within one integrated web application, with features relevant to each role.
Company-based access	Restrict event organizers to their company's information, support multiple organizers within a company, and allow content specialists to access customer checklists across companies and countries.
Time-zone considerations	Account for different time zones when keeping records, as the client identified use of the product in Australia and the United Kingdom.
Prototype and feedback	Demonstrate the core functions through an interactive web prototype and refine them using client feedback. A working full-stack implementation would depend on the team's available time and resources.

Out of Scope

Area	Description
Rebuilding existing checklist-use functionality	Rebuilding the full process used by organizers to carry out checklists at events. The client said this existing functionality could be assumed to be available. This does not exclude reviewing and acknowledging custom risk conditions.
Additional primary user roles	Separate functionality for traffic police, safety auditors, and excursion coordinators. The client limited the initial prototype to the three core roles.
Separate native applications	Developing standalone native mobile or desktop applications, as the agreed prototype approach is web-based.
Separate portals for each role	Developing and maintaining independent applications or domains for each of the three user roles, based on the client's preference for having all user roles in one integrated application.
